

Recitation 4:

Pointers, Arrays, Strings

Thursday, February 12th, 2015

Pointers (1/2)

- **Variable:** represents a memory location that stores data (size vary according to datatype).
- **Pointer:** is a variable whose **value** is an address of a memory location (size of a pointer is always the same on a system: **4 bytes on a 32 bit** machines, and **8 bytes on a 64 bit** machine)
- **Basics: (Don't get confused!)**
 - **&** Address Operator : **&<variable>**
 - ***** Dereferencing Operator : *** <pointer>**

Pointers (2/2)

Memory

x

px

				100								4												
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	

```
Int x;  
Int* px;
```

```
px = 4  
x = 100  
&x : ?  
*px : ?
```

```
*x : ?  
&px : ?
```

code: pointers.c

UNIVERSITY OF MINNESOTA

Arrays

Declare and initialize entries immediately:

```
Int class_sections[5] = {30, 20, 40, 25, 10};
```

Declare and initialize entries later:

```
Int class_sections[5];  
class_section[0] = 30; class_sections[1] = 20; ...
```

Array as a pointer:

```
char my_characters[5];  
*my_characters = 'E'; *(my_characters + 1) = 'F'; ...
```

Strings

A **string** is an array of characters that is null-terminated

```
Char name[10] = { 'B', 'a', 'n', 'n', 'o', 'n', '\\0' };
```

```
Char name[10] = "Bannon";
```

```
Char name[] = "Bannon";
```

```
Char* name = "Bannon";
```

What happens when the '\\0' char is missing?

UNIVERSITY OF MINNESOTA
Driven to DiscoverSM

Conclusion

- Demos
 - pointers.c
 - arrays.c (skip)
 - strings.c

Questions?
